# All deicers present same basic environmental challenge

- We are dispersing chemical into the environment
- All chemicals affect the environment in different ways
- There is no “perfect” deicer chemical

# Basic Ice Control Chemicals for Deicing Use

- Salt (sodium chloride)
- Potassium chloride
- Calcium chloride
- Magnesium chloride
- Urea
- CMA (calcium magnesium acetate)
- Potassium acetate
- Sand/abrasives

# Commonly Used Performance Enhancing Additives

- “Agricultural Additives”
  - Molasses
  - Corn syrup
  - “beet juice”
  - Brewers condensed solubles
- Corrosion inhibitors
- Colorants

# Basic Types of Environmental Impact

- Soil
- Air
- Vegetation (particularly roadside)
- Ground water/wells
- Surface waters
- Aquatic/animal life
- Infrastructure corrosion

# Deicer Environmental Strategy

- Understand chemicals' environmental effects
- Understand chemicals' performance characteristics
- Choose the right chemical and application procedure for the right condition
- Maximize deicer efficiency!

# Liquid Deicers – very important tool for minimizing chemical use

- Liquid deicers allow chemical to be spread in a very thin layer on the road
- Allows application of a small amount of chemical to prevent ice from bonding

# The Importance of Anti-Icing

Applying salt to an existing snow pack

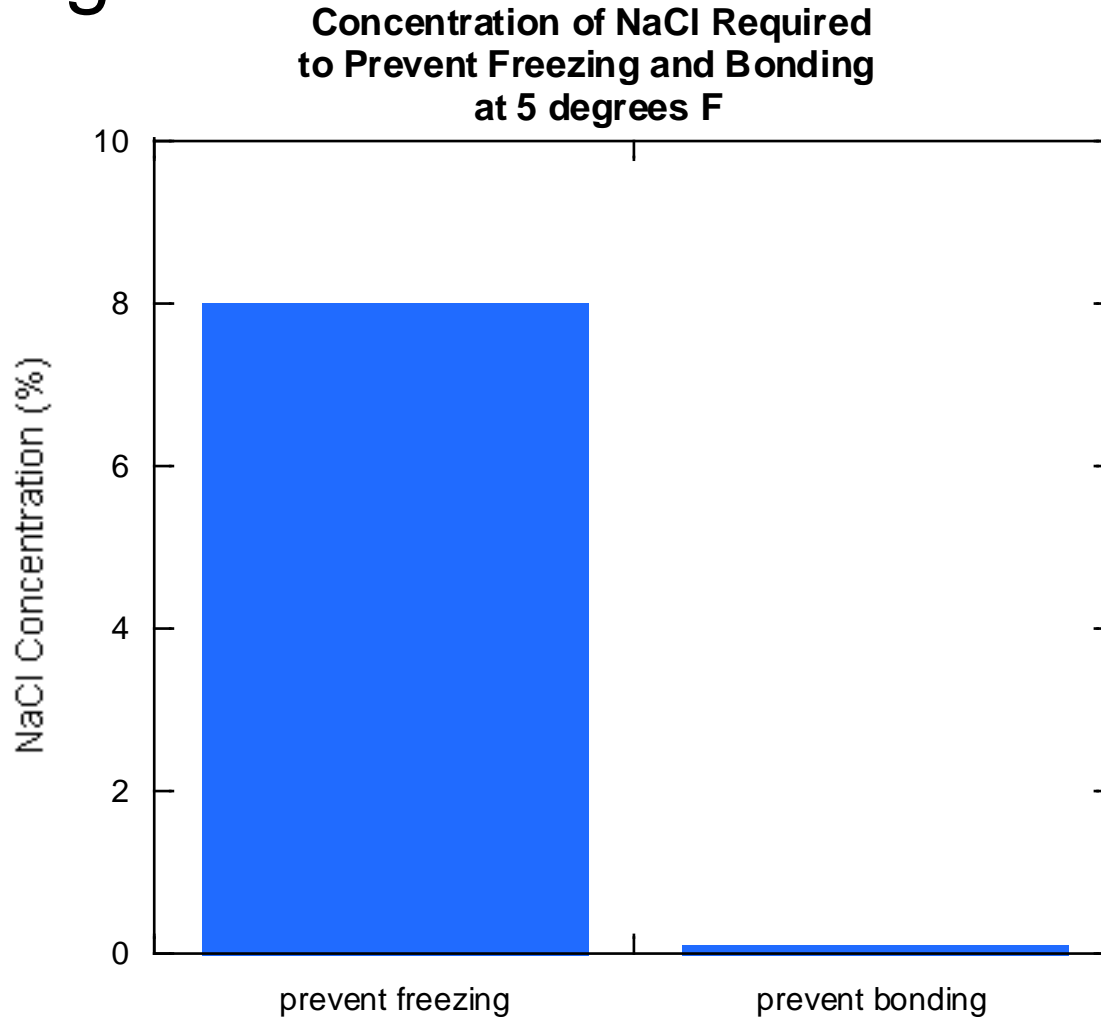

- Often unavoidable
- Always inefficient
- Most of the salt is “wasted” melting through the snow pack to reach the pavement

© 2012 Cargill, Incorporated All Rights Reserved

# Very little salt is required to prevent ice from bonding!

© 2012 Cargill, Incorporated All Rights Reserved

# Sodium Chloride Brine

- Lowest Cost
- Saturated brine “freezes” at 32 °F
- Eutectic brine (23.3%) freezes at –6 °F
- Not hygroscopic (will dry out)
- No slipperiness formation
- Best used for
  - Anti-icing at warmer temps (> 20 °F)
  - Prewetting at the spinner
- Not a good choice for a stored, pre-treated salt product

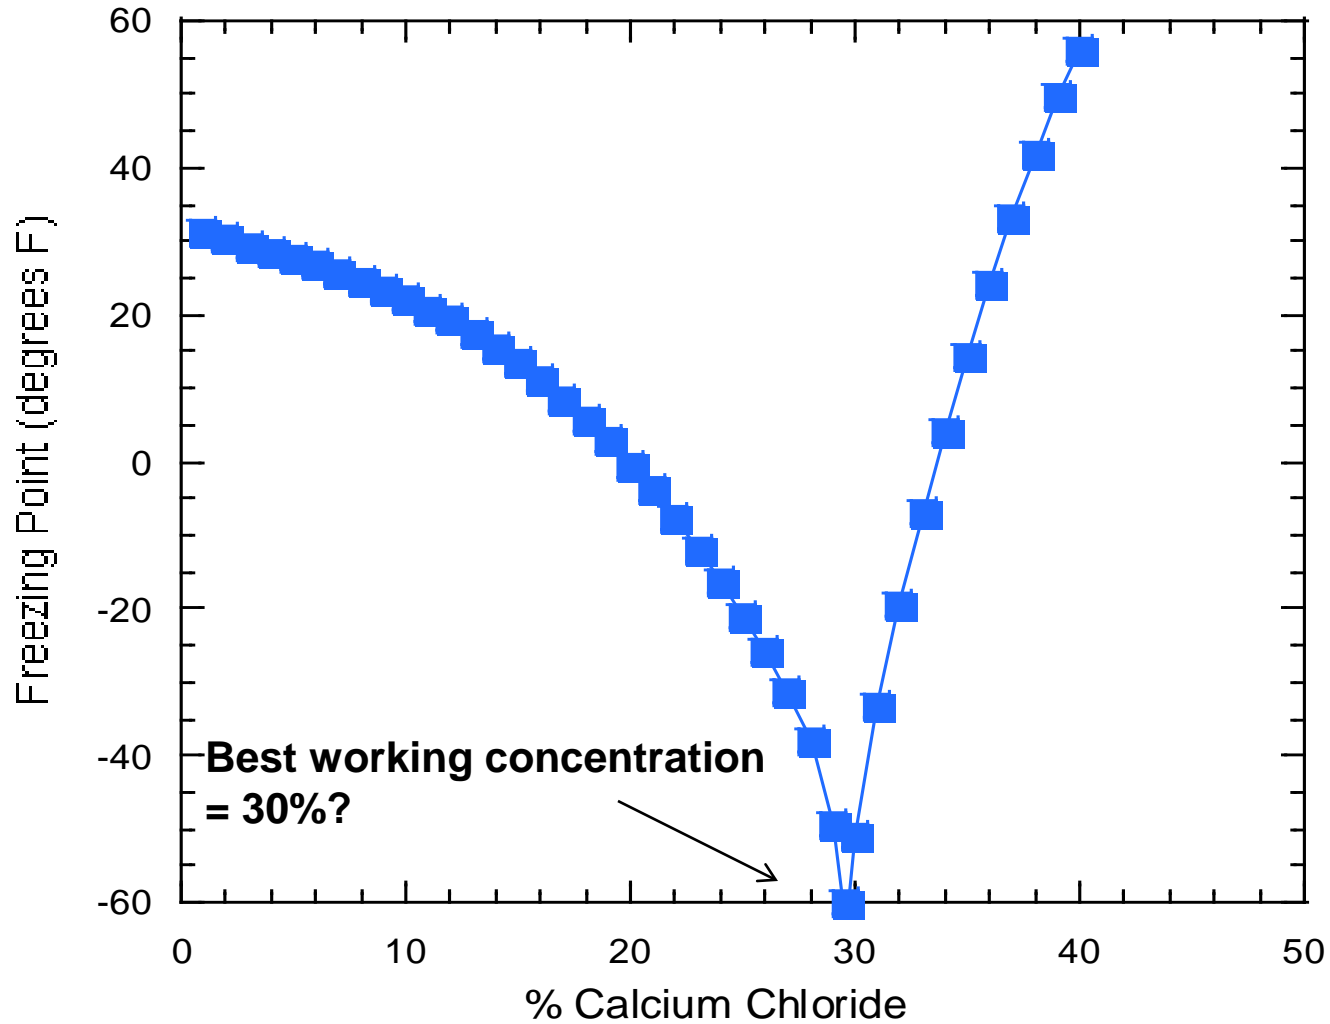

# Mag and Calcium Chloride Brines

- Higher Cost
- 30% mag chloride freezes at 2 °F
- 30% calcium chloride freezes at -60 °F
  - Very low fp is because 30% is the eutectic
- hygroscopic (will stay moist down to ~ 30% RH)
- Best used for anti-icing and prewetting at colder temps (< 20 °F)
- Best choice for a stored, pre-treated salt product (because of resistance to freezing and drying out)

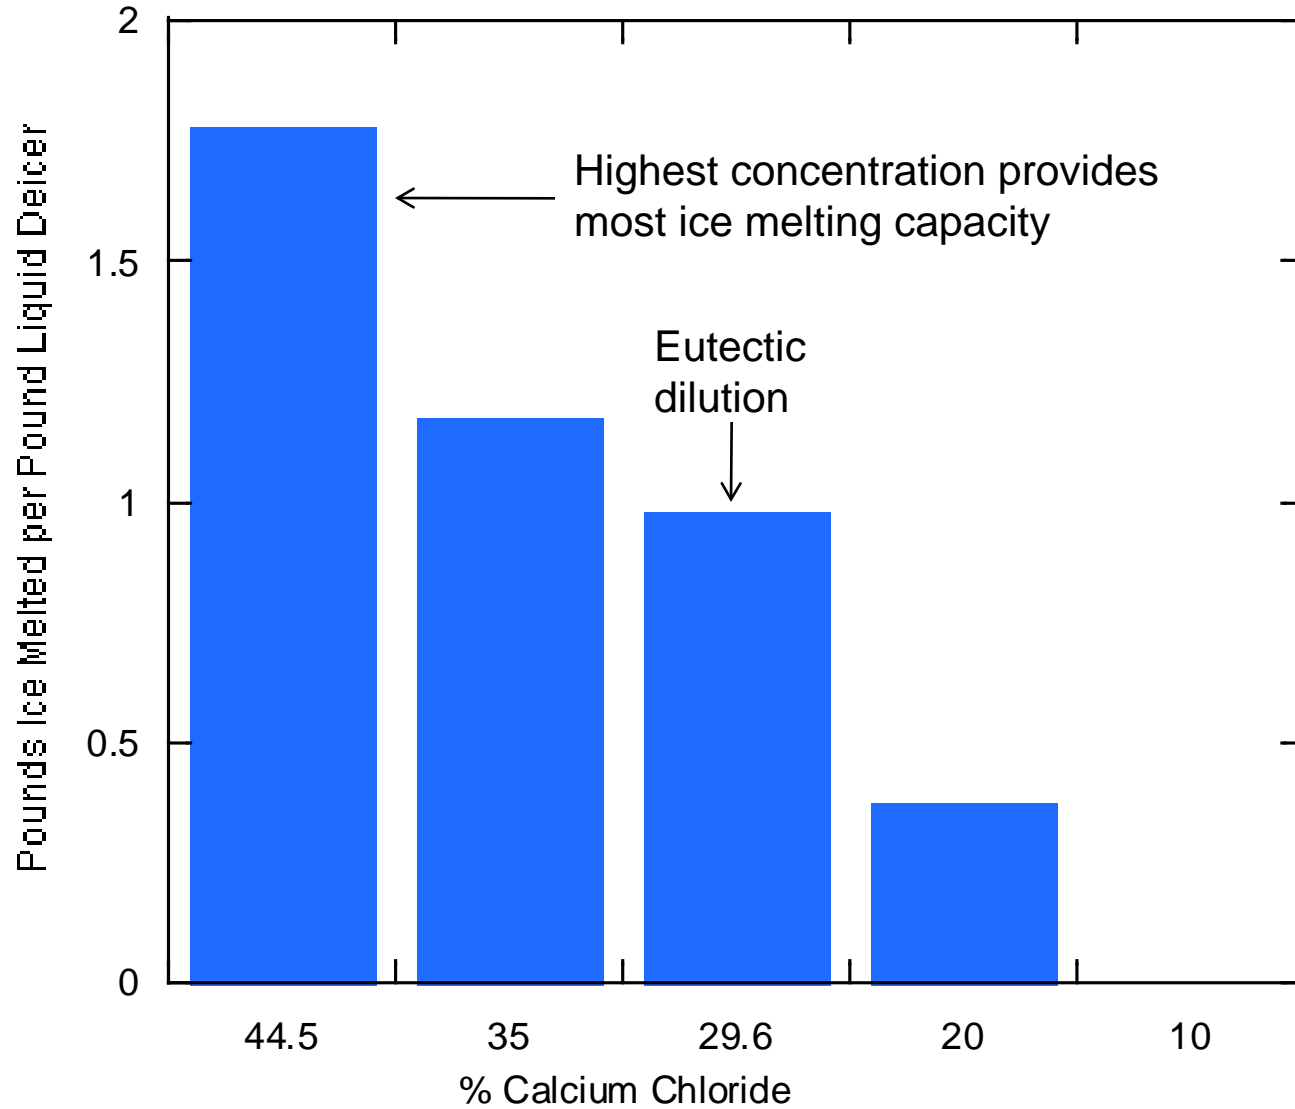

# Cautions in Mixing Brines

- Mag chloride + calcium chloride -----> sulfate precipitation
- Mag/Calcium chloride + salt brine -----> salt crystal precipitation
- Mag/Calcium chloride + potassium acetate -----> hydroxide precipitation

# Calcium Chloride Solution

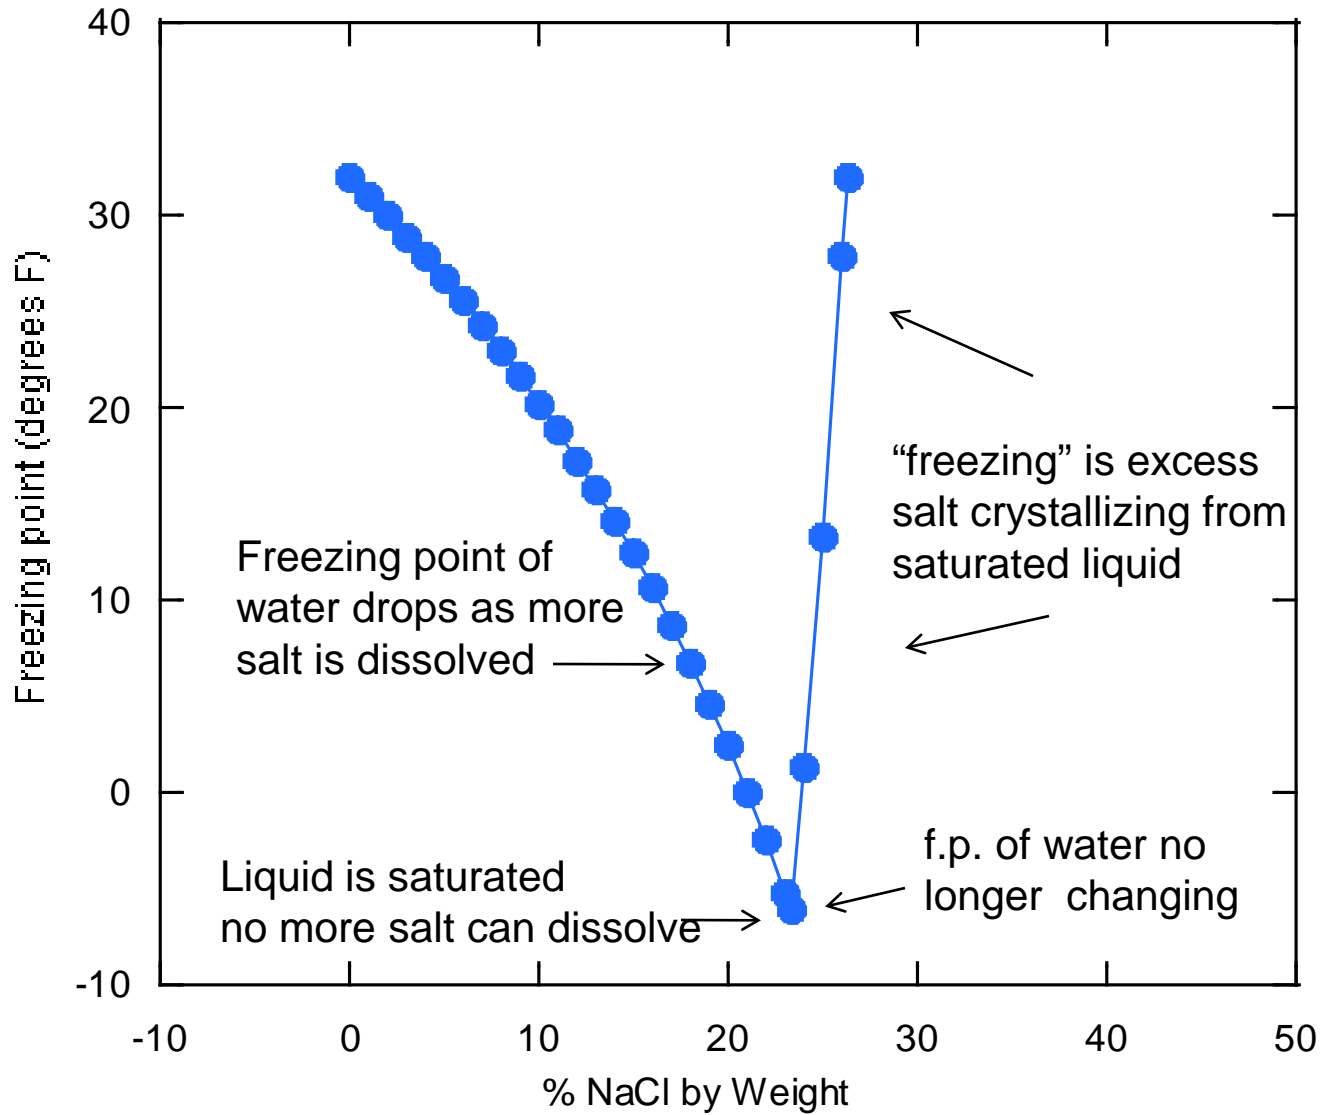

# Ice Melting Capacities 15 degrees F After 60 Minutes

So what happens if we put “too concentrated” liquid on cold road?

Excess solid deicing chemical crystallizes out  
Will solid deicer still melt ice? Of course!

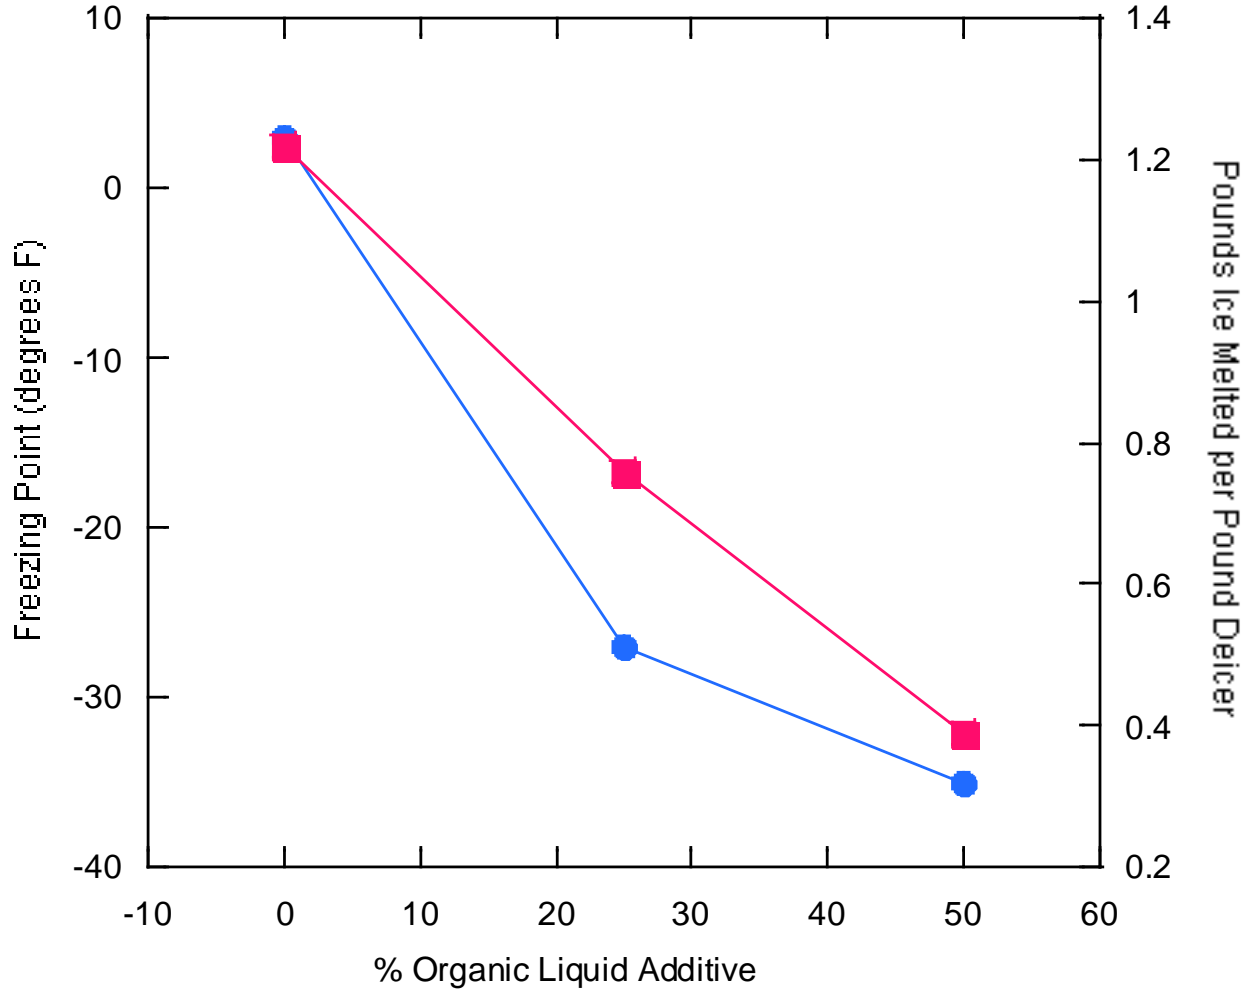

# ***Deicer dilution can have some value***

- Better low temperature storage stability
  - 26.4% salt brine “freezes” at 32 °F
  - 23.3% salt brine stable to – 6 °F
- But higher concentrations will always give more ice melting capacity

● Freezing Point

■ Ice Melting Capacity

### 31% MgCl<sub>2</sub> Brine + Organic Liquid Additive

© 2012 Cargill, Incorporated All Rights Reserved

# *Potential Organic Additive Value*

- Improved residual effect/anti-icing?
- Corrosion inhibition
- Leaching inhibition
- Lower temperature ice melting???
  - Unlikely
  - Must be verified by a performance test
  - Lower liquid “freezing point” does not indicate lower temp ice melting
  - ASTM D1177 is not accurate for f.p. of liquids containing cryoprotectant type additives

# The Value of Pre-wetting

- Pre-wetted salt permits 20-30% lower application rates of chemical
- Pre-wetting appears to make salt usable at colder temperatures
- Above 20 °F salt is most efficient ice melter
- Below 20 °F salt benefits from pre-wetting with mag or calcium chloride

FIGURE 1

Salt pre-wet with liquid calcium chloride  
 From Michigan Dept. of State Highways Study 1972-73  
 H. Lemon, *Better Roads*, July, 1974, pp 20-21.

# Faster Ice Melting at Colder Temperatures

- “At 2<sup>0</sup> above zero (calcium chloride) wet salt section was cleared 4 to 6’ . . .when dry salt was just starting to work” (Lemon, 1974)
- At 3<sup>0</sup>F MgCl<sub>2</sub> treated salt resulted in a markedly higher friction than NaCl wetted salt (Torgier Vaa, Norway field test, 2001-2002)
- At 14<sup>0</sup>F pre-wetted salt showed significantly faster recovery of friction in lab tests over 6 different pre-wetting agents based on CaCl<sub>2</sub> and MgCl<sub>2</sub>\*

# Michigan Field Ice Melting Observations (1974-75)

## Prewet Salt\*

- Starts immediately
- Starts immediately
- Minor delay

## Temperature

28 °F – 32 °F  
25 °F – 28 °F  
Below 20 °F

## Dry Salt

minor delay  
10-20 minutes delay  
> 30 minutes delay

\* Prewet with liquid calcium chloride. H. Lemon, 1974-75 Prewetted Salt Report. Michigan Dept. of State Highways and Transportation, 1975

# Pre-wet = Less Salt Needed

- 15% less salt used (James Sprang, Milwaukee County, WI, 1975)
- 24-44% saving in salt consumption (Horst Hanke, Wiesbaden, Germany 1994)
- 40% less salt used at low temperatures (C.L. Huisman, Iowa State Highway Commission, 1973)
- 28-38% less salt used (S. Kahl, Michigan D.O.T., 1999-2002 field tests, Transportation Research Circular, Number E-C063, June, 2004, pp. 552-554)

# Proper Salt Storage

© 2012 Cargill, Incorporated All Rights Reserved

# Salt Storage Best Practices

- Provide good drainage away from stockpile
- Contain drainage in reservoir – use for prewetting if possible
- Outdoor piles must be securely tarped
- Leaching from pre-wetted salt piles can be minimized by using a viscous pre-wetting liquid

# Leaching Test

Deicing Salt + 8 gal/T Liq MgCl<sub>2</sub>  
80-90% RH

© 2012 Cargill, Incorporated All Rights Reserved

- Visc = 25 cP (7.5 gal/T)
- Visc = 2350 cP (7.5 gal/T)
- ▲ Visc = 2350 cP (10 gal/T)

**Leach Test**  
**80% RH, 75 F**  
**Deicing Salt + Liq MgCl<sub>2</sub>**

# Conclusions

- Chemical deicers provide enormous value in preventing accidents, saving lives, and keeping transportation open in the winter.
- As urbanization increases, the possibility of increasing environmental impact exists
- Over application of chemical deicers can have a variety of potential negative environmental effects

# Conclusions

- A major key to environmentally conscious deicing is minimizing application rates
- Liquid deicers have proven to be highly effective at reducing application rates over long experience in highway deicing
  - Direct liquid application anti-icing
  - Pre-wetting of salt
